APPENDIX

Marked-up version of Claim 3

3. (amended) A method for calibrating a color display having brightness and contrast controls that receives signals from a host computer in a plurality of color channels, said method comprising the steps of:

increasing the contrast of the display to about a maximum level for the display;

increasing the brightness of the display for at least one color channel to about a maximum level for the display;

lowering the brightness of the display of at least said one color channel until superposition of colors is observed; and

[measuring at least the neutral balance and tone reproduction of said display; and adjusting said balance and tone to match desired values]

calibrating said display to set the white balance when said superposition of colors is observed.
